PROCESS METHODOLOGY

Acidic water overflows from tailing thickener/ phosphate thickener is stored in a water reservoir. This water is acidic in nature & contains high concentration of calcium and magnesium salts.

The purpose of acidic water treatment is

- a) To neutralize the acidity of feed water
- b) To reduce Ca & Mg concentration
- c) To remove suspended solids.

Due to nature of input quality of water, the lime soda process is the most effective to remove the hardness and to reduce the other parameters to meet desired output quality.

The existing acidic water treatment plant comprises of clarification system and pH correction system.

The water treatment plant primarily consists of feed water tank, feed water transfer pumps, high rate solids contact clarifier. The raw water is pumped to HRSCC. This water enters into the flash mixing zone of clarifiers, where FeSO₄, alum, soda ash and lime is dosed for coagulation and hardness removal.

Water from mixing zone then enters into the detention zone, where agglomeration of coagulated particles takes place to form heavy/ large size particles. These particles then settle into the clarification zone and clear water overflows into the peripheral launders & is then led to neutralized water tank. In solid contact clarifier, incoming water is brought in contact with already formed sludge with the help of variable speed impeller thereby achieving a solid contact, which enhances the settling efficiencies of suspended solids. H₂SO₄ is dosed in the neutralized tank for bringing down the alkaline pH to a range of 7-7.5.

Sludge from the clarifier is collected in sludge pit and from where it is pumped to centrifuge. Solid cake from centrifuge shall be made available for disposal. Filtrate of centrifuge is sent back to the feed water tank. Dewatering polyelectrolyte is to be dosed (optional) in centrifuge for effective coagulation & flocculation of the sludge generated.
